Once in the menu, there's some terminology you'll need to get familiar with. All actions affect a layer's underlying image data. A "mask" is used to specify one or more pixels that don't affect the underlying data. A "saturation" slider sets the color at the specified location. A "curve" is just a rectangular area of a specified color with a curve set on it. The preset effects are the "curve effects" available, as well as the "rainbow" and "poster" effects. You can click on one of these to choose from a list of curves. For example, the "Curve" effect may include a colorized panel that lets you pick a 16-color palette, or you can pick from a palette of 16 colors. The selections highlight the entire panel, so you can click anywhere in the image and drag the selection out. While dragging, you can keep your mouse button held down to get the control point, which is a visual cursor that shows the line where you're about to edit the image. You can also click anywhere in the image to set a new cursor, typically an arrow. To perform a reduce-dynamic-range sort of operation, just paint or highlight a large range of values in the histogram. You can then drag that area to the right of the image, or down. You can also click on a value to set it as the background value. Text appears in the layers panel (and the Layers dialog box) in the order it appears on the canvas. If you rearrange it in the Layers dialog box to be in the order it appears on the canvas, it'll reappear in the same order in the layers panel. However, you can move it up or down by dragging it.

As we move forward with this transition, some of the features that will be depreciated include: **Particle** and **Highlight & Shadow**. The toolset that allows users to paint images and create effects around them (Particle), will be transitioned to **Lens Flare**, a cross-platform filter with the same properties as Particle. Similarly, **Highlight & Shadow** will be transitioned to **Live Colors**, an updated version of the popular **Color Replacement** toolset. When combined with their respective native 3D features, Substance Designer Core and Substance Designer CS6, these native tools can now be used to combine and map high-fidelity, direct illumination to a dynamic 3D scene, and work seamlessly with existing references and vertex painting. That being said, we must share with you that the future of Photoshop and Photoshop CS6 will not solely be about depreciating the legacy features. Rather it focuses on building native APIs, to help us converge Photoshop and the design and creation tools in Creative Cloud across GPU and CPU alike, with features such as Resource Management and Multicamera. This new architecture utilizes modern coding techniques to provide a more stable and consistent platform for our newer capabilities and to further enhance the overall experience of our most recognized software. It is also worth highlighting that this transition will mean the release of older and newer versions of the software, which we will continue to push and support until all content is transitioned over. You really have to try it out to see how the new APIs work and how you can use them to create something exciting.
