Open retrosigmoid mastoidectomy without obliteration of the external auditory canal. From 1981 to 1984, retrosigmoid mastoidectomy was performed on 26 patients to remove their cholesteatomas and to improve hearing by means of translabyrinthine or translabyrinthine approach. There were no deaths. Follow-up has been continued through September of 1985. Hearing improvement was observed in all 26 cases, although the significance of the hearing improvement was discussed. No facial nerve dysfunction was observed.

TGF-beta 1 and 2 mediate macrophage adhesion and migration in vitro. The survival and colonization of microorganisms by macrophages are crucial events in the immune response. Upon sensing the presence of a microorganism, macrophages adhere to and migrate into areas of infected tissue. The identity of macrophage adhesion molecules that mediate these processes is unclear. Here we show that macrophages adhere to and migrate on immobilized TGF-beta 1 and TGF-beta 2, two factors recently shown to be produced by macrophages in response to bacterial infections. Cross-linking of macrophage adhesion molecules with purified TGF-beta 1 or TGF-beta 2 resulted in adhesion and migration on plastic and glass. Inhibition studies of TGF-beta 1 and 2 function using neutralizing antibodies suggested that TGF-beta 2, but not TGF-beta 1, may be a key determinant of macrophage recruitment. Studies with recombinant soluble TGF-beta receptors indicate that the type II TGF-beta receptor mediates macrophage adhesion and migration. These data indicate that TGF-beta 1 and TGF-beta 2 mediate
