The final, explicit native dimensionality of the Fill asset types means that Photoshop will now be able to perform 3D edits and view effects, while leveraging the native rendering capabilities of the integrated drivers of the host machine or display. More apps and features are supported natively, including Fill RT, like they were 2D assets. Photoshop can render and animate such assets like any CT-based plug-in, plus apply 3D content effect previews and the View and Animator features, like classic Photoshop. This makes it possible to edit and manage 3D content that would otherwise need to be managed as a 2D asset within Photoshop. With the new Fill RT asset type, the native capabilities of this new and powerful tool are also available to view and edit any 3D content that was made in a 3D rendering package. This means that courses or content libraries are now truly editable, and are accessible for rendering on any commercial grade 3D texture/material platforms. In addition to conversing in the native formats of the GPU import/export APIs, it should also be easier to create 3D content as part of the raw workflow, since the file format will be more restrictive, and the native software will have more control over what is rendered. In the upcoming version of Photoshop CC, PSCC, image viewers will also be able to 'know' 3D assets, and better render them. This native content editing path should lead to much better looking content in time. For designers, the new Support Perspective for 3D assets made a big impact in current projects, when enabling an easy workflow between design and color tools. Allowing designers to review their palate selections over and over again without having to worry about the quality and risks of saving content that was altered in color space was a major victory in the war against time and labor spent designing for every tweak and edit.
