

# Morbida Marina E La Sua Bestia

In the summer of 1998, Marina and I met in Paris during the Runway Show. The first time we met I felt very nervous and shy because I was seeing her for the first time, but we were able to communicate and we had a very nice time talking. In the following year we became good friends and every time we go to the cinema we have a lot of conversations or moments of pure laughter. At that time I was working as an assistant director.

Long-term results of the endoscopic-to-exoscopic transsphenoidal approach. This retrospective study was performed to evaluate the long-term results of the endoscopic-to-exoscopic transsphenoidal approach for pituitary adenomas. Between December 1998 and August 2003, the endoscopic-to-exoscopic transsphenoidal approach was performed for 128 pituitary adenomas in 127 patients. The patients' ages ranged from 27 to 84 years (mean: 55.1 years). The sex ratio (M/F) was 57:69. Forty-five patients (35.2%) had endoscopic transsphenoidal surgery, and 82 patients (64.8%) underwent exoscopic transsphenoidal surgery. Six patients who had undergone endoscopic transsphenoidal surgery had a second-look endoscopy because of a mass regrowth or a nonvisualization of the pituitary fossa. The patients who underwent exoscopic transsphenoidal surgery underwent a second-look surgery for the following reasons: cerebrospinal fluid (CSF) leak during the initial surgery in 5 patients, and adhesions between the sella turcica and the sphenoid sinus in the other 77 patients. This study included a total of 99 patients (77.3%) who underwent the second-look surgery. The mean follow-up period after the initial surgery was 44.2 months. The rates of total resection, partial resection, and nonresection were 100%, 0%, and 0% in the endoscopic group and 95.3%, 4.7%, and 0% in the exoscopic group, respectively. Six of the 47 patients (13%) who had undergone endoscopic surgery had a postoperative complication, such as CSF leak, diabetes insipidus, hypopituitarism, and wound infection. Five of these patients (83.3%) underwent second-look surgery. The overall incidence of CSF leak during the second-look surgery was 11.1
